

Project Design Phase
Proposed Solution Template

Date	03 October 2026
Team ID	6ab4d8aca238dc999eb5c33f
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Employee training details are kept in spreadsheets and entering them one by one into ServiceNow is slow and error-prone. Records are not linked to the employee (for example department), which makes reporting difficult, and there is no control over who can view or edit the data.
2.	Idea / Solution description	Import the spreadsheet (Training Name, Completion Date, Status, Employee) into ServiceNow using Import Sets and a Transform Map. Each record is linked to the employee through a reference to sys_user, and the Department is pulled into the record by dot-walking. Data is secured with an HR Manager role and Read / Write ACLs, and verified by impersonating users.
3.	Novelty / Uniqueness	Fully low-code solution built with ServiceNow platform features (Import Sets, Transform Maps, dot-walking, ACLs) without custom coding. Department is shown automatically from the employee record instead of being typed again, and role-based protection is applied from the start.
4.	Social Impact / Customer Satisfaction	HR teams get accurate and up-to-date training data in minutes, with less manual effort and fewer errors. Employee information is visible only to authorised users, which builds trust and protects privacy.

5.	Business Model (Revenue Model)	Delivered as a reusable application on the organisation's existing ServiceNow subscription. Revenue can come from a one-time implementation / customisation service and a support plan for organisations that want to import and secure their data in ServiceNow.
6.	Scalability of the Solution	The staging table, Transform Map and ACL setup can be reused for any new spreadsheet or larger data volume. More users, roles and tables (for example leave or asset records) can be added with the same approach, and the cloud instance scales with the organisation.
